

NIGHTFORCE™

Nightforce Angle Degree Indicator w/Mount – NFADIMT

Did you know you may have missed your 500 yard shot by 12 inches or more; worse yet – how about your 1000 yard shot missing the mark by 60 inches or more? Your target was safe because you weren't able to correctly adjust for the 25 degree angle of the shot. You don't have to miss your target anymore! Nightforce Optics has taken the guess-work out of up-hill and down-hill angle shots with their all-new Angle Degree Indicator w/Mount (ADIMT). The ADIMT has proven itself as a crucial piece of equipment for the long-range precision shooter.

Nightforce Optics has introduced an Angle Degree Indicator (ADIMT) system with a snag resistant, compact, ultra low profile Picatinny mount. For speed and simplicity, the Angle Degree Indicator (ADI) is calibrated in degrees rather than cosine numbers, allowing the bore slope angle reading to be directly entered into the Nightforce ballistic software program on your Pocket PC or used with a pre-printed angle drop chart.

Precision machined from high strength aluminum alloy and finished in hard-cote, matte black anodizing, the ADIMT complements the entire line of Nightforce riflescopes. All edges and corners have been finished with a micro radius to significantly reduce the chance of snagging on clothing, gear or foreign materials in the field. The ADIMT does not interfere with the operation of the firearm or rifle-scope in any way. The two piece mount design allows easy installation without removing an already installed riflescope.

We are confident that you will find the new Nightforce ADIMT to be the finest instrument of this type available anywhere.
